ALL Street has brainwashed investors into believing that a “buy and hold” strategy is the best way to make money in the markets.

But nothing could be further from the truth.

The truth is there are numerous solid investments right now primed and ready to spin off huge windfalls that could put millions in your pocket. In fact, my research has shown that every year, on average, 43 stocks rally 1,000% or higher!

That means there are 43 opportunities every year to turn $1,000 into $10,000 or turn $10,000 into $100,000.

In fact, there’s an average of three to four opportunities to grow your money 1,000% every month.

The key is identifying the golden thread … the DNA of these fantastic opportunities.

Now, many of these explosive stocks are genuine penny stocks. Illiquid, volatile and flat-out gambles for even the most skilled investors. We don’t want those stocks.

We want to make as much money as possible with as little risk as possible.

That’s why I spent about 100 hours researching every one of the stocks you’ll read about in this report. After combing through 13,000 hours of real-time market data, I found a common detectable DNA in stocks that are rock solid and primed to jump 1,000%.

Finding this common DNA has allowed me to create a strategy for pinpointing stocks on the verge of soaring 1,000% or more.

In this report, I will provide five companies that meet my strict criteria for identifying stocks that will soar 1,000% or higher over the coming months and years.

Let’s get started…

Senseonics Holdings Inc. (NYSE: SENS)

Over 100 million Americans are diabetic or pre-diabetic, making the disease a crisis that hinders lives every day. Between the monitors, the finger pricks and insulin injections, diabetic patients don’t have it easy — or cheap.

All told, the global market for diabetes equipment is expected to grow 7% every year, hitting $35 billion by 2024. Within that market, one breakthrough technology is set to transform the way patients control their condition.

It’s called a continuous glucose-monitoring (CGM) system. While glucose monitors aren’t new by any means, the accuracy and convenience of CGMs put them a step above conventional devices.

And there’s one company that’s pioneering the next wave of what these machines are capable of.

Senseonics Holdings Inc. (NYSE: SENS) is a medical-technology company that designed a revolutionary way for patients to keep tabs on their glucose levels.

Senseonics offers a system called Eversense that relies on a sensor inserted beneath a patient’s skin. From there, the sensor transmits data to an app for constant real-time readings.

Within 15 minutes, the system detects 95% of hypoglycemic episodes (low blood sugar) and 99% of
hyperglycemic episodes (high blood sugar.) Once detected, it'll send an alert to an on-body transmitter and a smartphone app.

The Eversense transmitter can even give patients a vibration to alert them to an episode in case they’re asleep or away from their phones.

Other CGMs on the market require patients to switch out their sensors at least every week. With the Eversense system, sensors can last under the skin for up to three months — six months in the case of the Eversense XL model.

Not only does Eversense replace the endless prick tests, but it also gives patients an alternative to constantly switching out sensors like other CGMs.

Across the board, CGMs will replace the outdated glucose monitors once more patients see their convenience.

Analysts project the CGM market to grow 42% every year. By comparison, the market for insulin pumps will shrink 4% every year. Needless to say, this is a trend that’s about to skyrocket before long, and we have the opportunity to claim our place in it now.

**Senseonics Is Set for Explosive Global Growth**

With a compact solution to watching glucose levels, Senseonics’ Eversense systems are a convenient replacement for bulky, painful monitors.

Considering the company’s $410 million market cap, Senseonics is still a tiny company that will continue to innovate and improve its systems over time. That said, it will take time for these CGMs to fully take over the market.

Right now, it takes between 60 and 90 days for doctors to train up on Senseonics’ systems, get payer authorization and then schedule patients. This turnaround time will only shorten from here as more doctors and clinics learn about the innovative Eversense system and adopt it for their patients.

To help in the adoption process, Senseonics runs a mobile clinic to help train patients and health care providers alike learn the system’s benefits and how to use it properly.

The FDA only approved sales for Eversense in June 2018. By the end of 2019, Senseonics predicts 10,000 patients will use an Eversense monitor to track their glucose. That goes to show how we’re buying into this technology right at the beginning of its growth.

The longer-term model, Eversense XL, isn’t approved yet for U.S. sales, but when that approval comes, it’ll be another huge catalyst for Senseonics’ growth.
Both Eversense models are already approved and sold in several European countries, where biopharma giant Roche distributes the systems.

Remember, Roche was the company that bought out one of our previous Extreme Fortunes stocks, Foundation Medicine. This is an enormous company with a huge budget — and a keen eye for spotting innovative technologies.

With Roche's wide outreach, Senseonics has a global sales network to benefit from as it innovates its products. It also shows that Senseonics' CGMs are innovative enough to get the attention of the industry's big names — and Wall Street's biggest investors.

**Roaring Financial Growth Ahead for Senseonics**

With its innovative and convenient approach to monitoring glucose, Senseonics can take over the $35 billion market for diabetes equipment. And because we're investing in this technology so early on, we're set to benefit from explosive growth.

By 2021, Senseonics' revenue is set to skyrocket to $242 million. Compared to the $6.4 million the company brought in back in 2017, that's an unheard-of 3,681% growth!

These phenomenal projections are more than achievable when you take into account the market adoption for Eversense, U.S. approval for Eversense XL and global sales through Roche.

With several key catalysts on the horizon, Senseonics has the ValueAbility that we need to see in our stocks before buying in. And since the company's product steals so much demand from inconvenient and clunky monitors, Senseonics' stock is a hot target for Wall Street investors.

In 2018, legendary equity firm BlackRock Inc. increased its holdings to over $27 million. And OppenheimerFunds, an asset-management firm, has over $8 million in this one stock.

When you take into account other institutional
buys from the Bank of Montreal and Goldman Sachs, Senseonics has the attention of Wall Street’s “who’s who.” This gives the stock its Insiderness, which shows that large institutional buyers will keep pushing up our stakes.

And with the company’s sharp revenue explosion inching closer, there’s no better time to buy in than now.

**Action to take:** Buy shares of Senseonics Holdings Inc. (NYSE: SENS).

**iRhythm Technologies (Nasdaq: IRTC)**

I’m sure we could all agree that the most vital organ in your entire body is your heart. Sure, you could survive in a coma for years with a brain injury — decades even.

But without your heart, you wouldn’t be able to survive at all. That’s why understanding heart health is so crucial.

It’s also what makes our next investment, *iRhythm Technologies (Nasdaq: IRTC)*, such an important, ground-floor company to get into.

See, iRhythm Technologies is a digital health care company with a product that’s single-handedly redefining the way we diagnose arrhythmias (a fancy name for irregular heartbeats).

When you have a cardiac arrhythmia, your heart beats either too slow or too fast. This can cause a whole host of different problems, including heart palpitations, dizziness, shortness of breath, fainting and anxiety.

While there are many different types of arrhythmias, iRhythm’s product focuses on one type called atrial fibrillation (AF).

With AF, instead of your heart contracting and relaxing like a regular heartbeat, the upper chambers of your heart tend to quiver. This makes it difficult for your heart to move blood into the surrounding ventricles.

When blood isn’t able to flow freely, it becomes blocked and starts to clot. And that’s when you get into dangerous stroke territory — or worse. If left untreated, AF has been linked to other life-threatening issues such as heart attacks, permanent damage to the organs and even death.

Up to 6 million people suffer from heart arrhythmias in the U.S. alone. However, this figure only accounts for people with a confirmed diagnosis.

Web MD estimates that nearly a quarter of the people who currently have AF have no symptoms at all — meaning that there could be millions of people out there suffering from the same condition who don’t even know it.

Luckily, once diagnosed, there’s still hope out there for people to lead a relatively normal life. And that’s where iRhythm comes into play.

**The Cutting-Edge Fix for AF**

iRhythm has taken all of the symptoms associated with AF into consideration and created a product that can monitor each concern.

Its Zio XT platform, which is a service that combines wearable technology and powerful data analytics, allows patients and their doctors to monitor cardiac arrhythmias better and faster than current technologies on the market today.

The way it works is simple. iRhythm has created a small, water-resistant patch that can record your heartbeat. It works whether you’re sleeping, showering or exercising.

One of the things that sets Zio apart from its competitors is that a patient can wear it for longer stretches of time, and testing proved it can record irregular heartbeats more accurately.
For example, a patient can wear Zio’s cardiac monitor for up to two weeks, whereas a Holter monitor — one of its direct competitors — has a wear time of only 24 to 48 hours.

iRhythm also outperformed Holter in a pilot study for detection of symptom-triggered arrhythmias. In just two days, Zio was able to detect 18 additional cases of AF in patients over Hotler, as well as a documented pattern of change in their heartbeats.

Because of this, doctors were able to change the treatments of 28.4% of patients to better suit their care needs.

This test confirmed that Zio is able to detect a more specific range of arrhythmia patterns than its competition. Accuracy can mean the difference between life and death in the medical field, so this makes Zio stand out in the market.

But that’s not the only perk that comes with this patch.

iRhythm connects patients to one of the world’s largest heart rhythm databases, which is accessible through its app. So, after you’ve been tested with Zio, the company gives you a comprehensive report that tells you about each of the following:

- Daily and total AF burden.
- Symptom and rhythm correlation.
- Heart rate trends.
- Interpretation of your specific heartbeat irregularity.

Zio even works for patients who have experienced a stroke, and helps them take precautions so that they don’t have another one. The best part is that you only need to go through the test one time to learn what type of arrhythmia you have and what treatment plan is best for you.

**Groundbreaking Results for the Zio Platform**

Recently, iRhythm released the results of a groundbreaking screening using its Zio platform. And these results showed an increased detection of asymptomatic AF in high-risk patients.

This is critical. It means that iRhythm’s product isn’t just able to detect AF in normal patients. It can actually detect AF symptoms in people who don’t meet the usual screening criteria and whose symptoms might have otherwise gone undetected.

Remember, it’s estimated that nearly a quarter of the people who have AF today don’t know about it. So Zio has the potential to cut down on the number of people dying from heart-related symptoms that would have otherwise gone untreated.

If you look at the chart below, you can see some of the results that came from iRhythm’s mSToPS study.

On a one-year basis, Zio allowed health care physicians to detect AF in 6.7% of their patients versus just 2.6% in the observational control group. Said another way, Zio was over 2.5 times more effective at detecting AF!
But what’s even more astounding is that they conducted this research study without the participants or researchers ever meeting. That’s because Zio is constantly collecting information and storing it in an app, so physicians have access to the data they need at all times.

There are several benefits to this. Wearable devices like Zio have the potential to cut down on costly and unnecessary hospital visits in between serious symptom flareups and allows patients to go about their lives like normal. And because the patch is so discrete, patients can wear it under their clothes, so no one is even aware of that person’s medical condition.

So, not only has iRhythm come out with a phenomenal product — one that works more than twice as well as what’s currently available — but it gives the wearer freedom of movement and discretion.

If you talk to someone with a serious medical condition, one of the most common things you’ll hear them say is that they “just want their life to go back to normal.” They want to be able to do the things they used to do and not feel like they’re sick all the time. Zio can offer that.

iRhythm has developed a phenomenal product that does more than just test for AF. It gives people their lives back, making their day-to-day activities safer and more convenient.

It’s always been my experience that when a new product comes on to the market that will make something better, faster and more convenient, mass adoption is soon to follow. This is exactly what I believe will happen with Zio as more physicians start to adopt this wearable device.

When that happens, iRhythm’s sales will go through the roof. And that’s when big-money investors are going to come pouring in to buy. That’s why we want to get into iRhythm now, while its company is still small and relatively unknown.

A Pattern of Growing Revenues

Year-over-year, iRhythm has shown improvements in its financial growth.

After going public in 2016 to raise money for its research, iRhythm's valuation has gone from $86 million to $107 million. That’s 210% growth in just under two years!
But the good news doesn’t stop there. iRhythm reported strong third-quarter revenues of $38.1 million — a 52% increase compared to the third quarter of 2017.

This tells me that iRhythm has developed one of the critical elements of my GoingUpness strategy called ValueAbility. The company makes something that’s of value, so its sales are now starting to grow — meaning it will have more cash on hand for further research and development.

Heart disease accounts for 1 in 7 deaths here in the U.S., so iRhythm is performing in both an important, and growing, market. In fact, iRhythm generated $98.5 million in revenue last year with Zio, and that’s just the beginning. The global cardiac monitoring market is projected to reach $28 billion by 2021.

This gives me complete confidence that iRhythm’s sales will remain steady as its company continues to grow.

Right now, projected revenue for the company is set to more than double from the close of 2017, reaching $261 million by 2020.

With annual sales growth rising every year into the future, now is the perfect time to invest in iRhythm. Once the rest of the market figures out the opportunity I just presented to you, other investors are going to rush into this stock and send its share price soaring.

However, it’s critical that you buy in today, because the first signs of this buying have already started…

Follow the Money Trail

iRhythm has already become the focus among many institutional investors and hedge funds.

For example, one Swiss National Bank already bought 15,800 shares of its stock, meaning it now owns 6.8% of the company. But that’s not the only large investor that’s started to pay attention.

SG Americas Securities LLC, Geode Capital Management LLC, Northern Trust Corp and Alambic Investment Management LP all either bought or increased their positions in iRhythm’s stock. The thing is, all this big-money buying is merely a fraction of the attention that’s soon to come.

iRhythm’s share price is currently three times what it was trading back in 2016, but it’s still incredibly cheap today considering the market this company participates in. But with large investors beginning to buy into iRhythm, it’s only a matter of time before this stock gets incredibly expensive.

That’s why we want to take advantage of this buying opportunity now, while we can still get in at a good price. That way, we stand to benefit as the company’s share price rises.

Action to take: Buy the shares of iRhythm Technologies (Nasdaq: IRTC).

GameStop Corp. (NYSE: GME)

When you look at today’s video game retailers, there’s only one brand name that stands out: GameStop (NYSE: GME).

That’s because GameStop has stood the test of time for gamers worldwide. And for many, it’s the go-to choice for new releases and classic games alike.
That’s because GameStop brings new life into a stale and stagnant retail environment. And in the process, GameStop points the video game industry in a new, innovative direction.

Now, to understand where GameStop plans to bring its brand into the future, it’s important to understand why it’s still the go-to choice for gamers today — especially in the age of Amazon.com. In fact, I believe GameStop is one retailer that has what it takes to stand up to the online monolith, and it all comes down to the in-person experience.

A Game-Changing Approach to Retail

In its more than 7,200 worldwide stores, GameStop sells both new and used video games and game consoles. So, while you’ll see flocks of people come into the store to get the latest blockbuster games, much of GameStop’s customers visit the store to load up on used games.

This new-and-used approach opens up the company’s target market, as it can appeal to gamers at a variety of different price points.

With its Game Informer magazine, GameStop publishes news, reviews, opinion sections and previews for upcoming games.

And through its PowerUp Rewards program, the company gives customers points for their purchases, which customers can redeem later for rewards and products. They can also get these rewards points by pre-ordering new releases, with some new games getting their own special midnight releases.

Together, GameStop’s magazine and rewards program keep customers coming back time and time again.

From a wider standpoint, these two factors might not seem alike. But on a personal level, it creates a bond between customers and the GameStop brand — a relationship that an Amazon order can’t build.

Taking Advantage of Collectible Demand

To broaden its audience further, GameStop branched out into the roaring new market for collectibles.

After years of cashing in on deluxe editions of games that often come with collectible figures, posters and other merchandise, GameStop leapt headfirst into the collectibles market.

Along with lining its own checkout counters with plush toys and novelties, GameStop’s management took notice of ThinkGeek, an up-and-coming competitor.

In its retail stores and online site, ThinkGeek sells licensed toys and merchandise from popular movie, video game and popular fiction franchises. In a groundbreaking 2015 deal, GameStop outright bought ThinkGeek, adding its fleet of stores to the GameStop Collectibles division.

Not only did this vastly increase GameStop’s store count, but the ThinkGeek deal also handed GameStop a wealth of exclusive product licenses.
So now, GameStop’s shelves share space between physical games and merchandise from Star Wars, Doctor Who, Pokémon, Minecraft and a roster of superheroes.

Collectibles are eye-catching additions to its shelves, and now GameStop attracts customers of all ages who love these franchises. And after the ThinkGeek takeover, many of these products can only be found at GameStop — and on GameStop.com.

Franchise collectibles are also great for purchase add-ons, which brings up the average amount of cash people are willing to spend during in-person visits.

Today, the decision seems like a no-brainer, as GameStop's collectibles segment is expected to pass $1 billion by the end of the 2019 fiscal year. By constantly adding new licensed merchandise, the company can keep customers buying from GameStop, instead of going to Amazon, where these products are unavailable.

So now, GameStop has this all-new stream of revenue in addition to its roaring gaming business. This has led to more and more of its earnings coming from product lines outside of physical games.

I believe that the company’s efforts to expand this new business segment will continue proving profitable, as the U.S. market for collectibles is already a giant $12 billion industry.

In fact, I believe that GameStop’s collectibles business is just one of several factors that will help the company triumph in video game retail.

The 1 Retailer to Stand Against Amazon

Over the past two decades, Amazon has snatched up countless businesses. From department store standbys like Macy’s, to bookstores like Barnes & Noble, Amazon dominated retail markets with its online platform.

Brick-and-mortar stores have had to adapt to keep up with this new online marketplace. Companies that make easy-to-use websites to sell their products get the benefit of a whole new revenue stream, exploding their business in the process.

In contrast, retailers that aren’t able to add online elements to their businesses often fall into decline.

Countless brands have faced this sink-or-swim transition, and GameStop’s no exception. But whereas other companies saw online retail as a hurdle to their growth, GameStop treated its online business as a reason to adapt and innovate.
So, while the company's physical stores are alive with activity, GameStop.com is just as active. Online purchases give customers their rewards points, which keeps them coming back to buy from GameStop. Plus, the online marketplace is a great space to sell these customers downloadable content for their games.

By creating an ecosystem where both in-person and online purchases go toward the same rewards, customers feel a connection with the GameStop brand.

Because, when you combine Game Informer, GameStop.com, preorder bonuses, used trade-ins and the roaring collectibles business, you can see that the company has every aspect of gaming covered.

Where other retailers can only offer a transaction, GameStop offers a relationship with its customers — a key factor that keeps customers coming in the door.

In fact, this customer-focused ecosystem has been so effective over the past few years, GameStop announced that 95% of its digital sales occur in stores. That's right, an overwhelming majority of gamers will even make their online purchase from a GameStop store — just because of its company-customer bond.

Plus, GameStop reports that over 25% of web visitors buy their products in-store within two days.

For other stores, this would be an impossible task. But with GameStop, it's proof of a solid business model that takes advantage of e-commerce instead of working against it.

Solid, Well-Rounded Growth

Like any other growing company, GameStop took some time to iron out the kinks of its business.

For some number of years, the company also operated some 1,300 Spring Mobile and Simply Mac stores as part of its Technology Brands segment. Spring Mobile worked with AT&T for phone sales and support, and Simply Mac offered sales and support for Apple products.

However, after the sharp rise of its collectibles brand, GameStop started cutting ties with its Technology Brands to focus on its core business.

With the $700 million sale of Spring Mobile, GameStop now has more cash to invest in its collectibles and games segments, buy back its stock, raise dividends or do a hybrid of all three options.

Regardless, GameStop is now ready for explosive future growth, and this extra bit of cash will go a long way in the company's rise to the top.

In 2017 alone, GameStop opened up 46 new locations worldwide, including 20 collectibles stores. Every one of those stores can help new gamers build a bond with GameStop along with its rewards program.

The more the company can spread its physical footprint, the more customers engage with its physical and online ecosystem. In effect, GameStop's video game empire builds itself, based off of the bond with its customer base.

This satisfies the ManageAbility factor of our GoingUpness strategy, which states that a company's business should be easily managed.

GameStop also reported phenomenal numbers after refocusing on its core business.

In 2018, GameStop saw a 6.9% increase in collectibles sales, which shows customers are eating up its merchandising products. On top of that, new hardware sales shot up 19% over the same time period, which shows GameStop's essential product lines are more in favor than ever.

While these figures give us a snapshot of GameStop's current environment, my research shows that several wide-angle economic factors will also help spur the company's future growth.

The first thing to keep in mind is that consumer confidence is the highest that it's been in well over a decade. Plus, the U.S. unemployment rate has fallen considerably over the past few years, and right now, it's at its lowest point since the 1960s.
When you combine both of these factors, you have a growing chunk of the population willing to spend their money in stores and online. When consumers are more confident, we often see a sharp spike in entertainment purchases like video games.

All in all, our economy and rising wages mean that more people have the extra funds to buy video games, and there's only one name in town that they're going to pick: GameStop.

That's why Rob Lloyd, GameStop's Chief Financial Officer (CFO), reported that GameStop's 63% increase in physical video game revenue outpaced the rest of the industry's 46% growth.

Now, GameStop's management is smart, and they know these phenomenal economic conditions will benefit the company in the long term.

So, company and market insiders have been buying back GameStop's shares slowly, and the stock has become increasingly scarce.

As you know, ScarceAbility is a huge part of our GoingUpness system, and this chart shows just how much of GameStop's stock is left on the market.

With insiders taking back shares, each GameStop share on the market becomes more valuable.

It also shows that company and market insiders realize the potential of GameStop's brand, as they steadily buy into that growth. We're going to beat these insiders to the punch and claim our stake. By buying into GameStop's stock, we can benefit from the company's video game industry takeover and roaring potential.

Action to take: Buy GameStop Corp. (NYSE: GME).

**Iridium Communications (Nasdaq: IRDM)**

It's no secret that we're heading into a new era of communication and technology. The first stage of this started with the internet, which served the purpose of bringing millions of people together from all around the globe. This was the “internet of people.”

But now we're beginning to enter a second stage of growth, and it's what many people in the markets are calling the “Internet 2.0” — or, the Internet of Things.

You see, with the Internet of Things, the devices we use every day are getting more and more connected. Our cars, homes and even the scanners at our grocery stores incorporate more and more sensors and chips to better interact with the world — and one another.

Of course, for these sensors to interact with each other and the computers that run our daily lives, they need to connect with each other first. Those connections are made through the infrastructure set up by global communications companies.

One of these companies is **Iridium Communications Inc. (Nasdaq: IRDM)**, a satellite communication company.

**Taking Stock in Satellites**

If you've ever stared up at the night sky and wondered what was up there, I doubt that satellites would be your first thought. After all, they aren't nearly as visible as the bright stars and planets we like to dream about.
Truth is, there are thousands of satellites orbiting our world every minute of every day. These cosmic outposts form the basis for a good portion of our electronic communication.

So, with the Internet of Things rapidly accelerating, it’s almost a no-brainer to get in on the ground floor of this infrastructure.

Iridium is a company that not only owns a number of these satellites, but also performs maintenance on them. So even though it sends satellites into space on a regular basis, it’s also developing new network technologies for more far-reaching communications.

Back in September of 2017, Iridium formed a partnership with Magnitude Space, an emerging small satellite company. The partnership is meant to collaboratively expand both company’s opportunities for space-based Internet of Things services with the development of reliable, Low Power Global Area Network (LPGAN) technologies.

For those unfamiliar with LPGAN, this is essentially a type of wireless communication system set up across a wide area network — so you can imagine how using satellites helps companies get their signals to a greater number of devices.

And as more companies hook their products into the Internet of Things, there will be a growing need for low-power, low-cost monitoring and tracking options — with the goal to bring connectivity to even the most remote locations around the world.

To understand how Iridium fits into this conversation, let’s take a look at how the satellite business works.

**Profits in Orbit**

The nature of the satellite business is that you have to spend a lot of money up front to build out your infrastructure. That’s because it costs a lot of money to build satellites and launch them into space before you can actually start to use them.

However, once the satellites are operational, they start to generate a lot of money. And because Iridium’s revenues are subscription-based, there’s a good chance that a reliable amount of money is going to flow into the company on a regular basis.
The business is also long-term in nature because of a lack of competition for Iridium. This is mostly due to the fact that the costs of putting up satellites is sky-high. Not many companies have the capital or the technical prowess to do it.

Now you see, Iridium is uniquely positioned to become a major network provider for the Internet of Things revolution for a few different reasons:

• With a market share of 24% in 2017, Iridium is ahead of the game in launching satellites into space.
• It competes in attractive and growing markets with favorable dynamics and high barriers to entry.
• The key sectors it participates in are land/mobile handsets, machine-to-machine, maritime, aviation and the U.S. Government — all highly-profitable avenues.
• It has a business plan for next-generation satellite constellation called Iridium NEXT.
• Its system of subscription-based revenue means a steady stream of revenue.
• Its number of Internet of Things customers has grown at a rate of 25% per year since 2011. This shows that the service is in demand and will give more reliable profits.
• It benefits from a large and low-cost ecosystem of partners, robust portfolio and large, highly-profitable recurring service revenue base.

Set to Launch

As you know, I measure every possible investment up against my GoingUpness system. I want to make sure that, before I suggest we get in on a stock, it has the right markers for success from the get-go.

So, first let’s get into some statistics about Iridium’s ValueAbility. I want to make sure that the company’s product, stock and future holds enough value to make it worthwhile for our investment.

Iridium owns a growing business in a growing market. With its revenues being up for four years straight, it is the market leader in both subscriber base and revenue.

This market growth is no laughing matter, either. The Internet of Things satellite communications market was $1.5 billion in 2017 with a projected growth rate of at least 12% per year. So we want to get into Iridium now, before its stock price begins to reflect its high-growth market potential.

Now, as I told you before, there is a huge upfront cost to the satellite business that might look a bit intimidating to you at first. So what you’re going to see is that Iridium has a high amount of debt — $2 billion of it. However, with current interest rates being so low, this is a smart way for Iridium to fund its business.

For investors, this is good thing, because it reduces the amount of stock that’s issued — thus increasing Iridium’s ScarceAbility.

Bottom line: Iridium will benefit greatly from the Internet of Things revolution and will make an everyday change to people’s lives. As a result, I believe that Iridium has the potential to send our portfolio into the stratosphere.

Action to take: Buy Iridium Communications Inc. (Nasdaq: IRDM).

Atlantic Power Corp. (NYSE: AT)

Editor’s Note: I considered a silver-mining company for your fifth position, but it lost its ValueAbility factor — a critical component of my GoingUpness system. For that reason, I no longer believe it’s set to deliver Extreme-Fortunes-worthy gains within a year. It’s on my watch list in case it regains its GoingUpness factor. But in the meantime, I have a new revolutionary recommendation that has the potential to rally 1,000% or higher in the coming months and years.
I've pinpointed a company that's in the middle of a massive turnaround. It's got a new management team, has been selling assets and reducing its debt, and is going to give us a uniquely profitable way to play the Internet of Things.

**Atlantic Power Corp. (NYSE: AT)** is a power company with a diverse portfolio, controlling 18 electricity power plants.

In terms of the power these plants can generate, Atlantic Power’s projects total 2.138 gigawatts of capacity. Just so you understand, this much energy is enough to power over 1.5 million homes.

The reason I’m bringing this up is because this is a huge amount of energy for such a tiny company to control. Its entire portfolio stretches across nine states and two Canadian provinces.

One big difference between Atlantic Power and your local power company is that it only deals with big utility companies and other large businesses. This is a business that’s called merchant power.

In other words, Atlantic Power sells power to your local utility company when your power company doesn't have enough energy, or if they want to shut their own plants down for maintenance or repair.

The way it does this is through long-term contracts. These contracts can last anywhere from five to 20 years. The good thing about long-term contracts is that you’re guaranteed to have a steady stream of revenue coming in.

The bad part is that you have to be able to renew those contracts when they come due.

Right now, the contracts for 13 of Atlantic Power’s plants don’t expire until 2022 or later.

Other investors worry that Atlantic Power won’t be able to renew them. That’s because in the early 2000s there was a bubble in merchant power plants. People put too many of them up and that cratered the prices for the power the plants generated. And to make matters worse, these were mostly financed with debt.

To make a long story short, Atlantic Power borrowed too much money and owned too many plants. In 2015, it fired the management that got it into this mess. Now, it’s run by management that understands the merchant business really well. And to prove that it knows what it’s doing, Atlantic Power’s management team has put some serious skin in the game by buying tons of its own company’s stock.

James Moore, the CEO, bought 40,489 shares in 2017 and Terrance Ronan, the CFO, bought 10,000 shares. In fact, by 2018, the management of Atlantic Power bought nearly $1 million in stock and preferred stock in the company.

You know that Insiderness is a critical component of my GoingUpness strategy. And the kind of buying we’ve seen in Atlantic Power’s stock is exactly what I look for. It especially catches my eye when a CEO or senior vice president go to buy shares.

Now, the big issue with Atlantic Power is debt. This is the reason why the stock is currently priced at around $2. You see, people think that Atlantic Power is going to struggle paying off its debt. However, the fact that the company's management team is buying huge amounts of its stock tells you that they clearly believe Atlantic Power is going to be okay … even better than okay.

**Shaving Off Debt at a Shocking Rate**

Atlantic Power has been restructuring its finances for years now. For 2017, Atlantic Power reduced debt by approximately $166 million and ended the year with considerably lower leverage than a few years ago. In other words, the company’s determined to pay off its debt quickly.

Now, there’s no question about it ... having a high amount of debt in any company is a risk to consider. However, you have to understand that debt is the most common way a company comes up with capital to put up an expensive project like a power plant.

So, a fairly high level of debt is a common thing in the merchant power business. And today, Atlantic Power’s debt sits at a manageable level. Meanwhile, its overall cash levels keep rising.
Right now, the stock market is acting as if Atlantic Power still has too much debt when in fact it’s completely OK. In other words, Atlantic Power’s stock price is too low for the assets it owns and the business that it represents.

As you know, I’m very bullish on the Internet of Things mega trend and I expect it to change life as we know it. One of the critical things needed for the Internet of Things mega trend to unfold is electricity, and that’s what Atlantic Power’s power plants provide.

Between 2007 and 2016, electricity demand shrunk as the U.S. economy crawled along, generating too little growth to stimulate demand. However, in 2017, that started to change with growth coming in at 3% ... and that’s continuing into 2019.

I estimate that it will take about five to seven years for us to catch up to 2007-like power production levels. And I believe that going beyond that level will take 10 to 15 years because it’s very difficult to put up new power plants today. That’s due to both regulatory and environmental restrictions.

In a nutshell, rising growth is going to reverse the trend in electricity demand and is going to put Atlantic Power in the driver seat. That’s because the company is going to have electricity plants that people want to contract at rising rates. But right now, at its current price, Atlantic Power barely reflects the value of its business, let alone rising demand and rising prices of electricity.

Bottom line: Atlantic Power is a stock that’s at a rock-bottom price point. However, this is set to soar as the Internet of Things and the U.S. economy grow. Both the demand and price of electricity will reflect this growth.

This is our opportunity to buy Atlantic Power on the cheap before everyone else figures out this opportunity ... and comes to bid its stock up.

**Action to take: Buy Atlantic Power Corp. (NYSE: AT).**

**Bonus Stock: Vanda Pharmaceuticals Inc. (Nasdaq: VNDA)**

**Vanda Pharmaceuticals Inc. (Nasdaq: VNDA)** is a little-known specialty pharmaceutical company that is focused on the development and commercialization of new therapies for the treatment of central nervous system disorders.

While the company is largely undiscovered, with a market cap of only $2.13 billion, Vanda developed a drug that I believe is going to become the next blockbuster hit. It will change both the pharmaceutical market and the lives of Vanda’s investors.

We have what could be the next breakout lifestyle drug from Vanda Pharmaceuticals — Hetlioz. And if I’m right, we have the chance to capture huge gains from its development.

On January 31, 2014, Vanda received FDA approval for Hetlioz. When the company submitted the drug
for approval, its purpose was to be the first drug to regulate the circadian rhythm of blind people, helping them to sleep.

Hetlioz ended up benefiting from a bureaucratic screw-up, and the FDA issued its approval for all people to use this drug. So now Vanda has the right to sell Hetlioz to pretty much anyone with almost any sleep disorder.

Essentially, the FDA handed Vanda an enormous gift because it expanded who Vanda can market Hetlioz to. Instead of just being able to sell this to a small percentage of the population, it can now sell Hetlioz to the 70 million people in the U.S. who experience any form of sleep disorder.

People are on the go more often than ever before, and our busy lifestyles frequently disrupt our sleep cycles. In fact, 50% of travelers leaving the U.S. fly through more than four time zones, and 80% of those people suffer from disrupted sleep.

In March of 2018, Vanda started a clinical trial to find out how effective Hetlioz was in treating jet lag. This is how all the lifestyle drugs become massive sellers. Using this drug is one way that addresses an issue for a lot of people ... in this case, sleep.

But Hetlioz isn't just for weary travelers. It also works for people who want to shift their sleeping patterns, either due to work, desire for nighttime leisure or for some other reason.

What's more, people who take medications for sleep disorders find that, often times, when one medication stops working, they need to try something new. Hetlioz offers them a new alternative.

Follow the Money Trail

Sales for Hetlioz are steadily rising. Its sales growth is indicative of two key things:

- First, Hetlioz prescriptions are now available to a wide audience, not just to blind people like it was originally intended.
- Second, rising sales are an indication that Hetlioz's safety is widely accepted and that doctors are willing to prescribe it to a large audience.

These are the reasons that Vanda’s expected revenue growth is an increase of 192% from 2017 into 2022. That’s an astounding 24% growth rate per year!

As investors, this is exactly what we want to see. It’s also why I believe Vanda is going to be an absolute stock market super star as Hetlioz drives its sales higher.

Right now, Vanda is a $20 stock with a stock market value, or market capitalization, of about $1 billion. The company currently has $248.8 million in the bank and no debt at all.

For 2018, Vanda told investors that it expects sales totals for Hetlioz between $108 million and $118 million. I believe the company is setting up to outperform those expectations in 2019.

As I’ve shown, Vanda's Hetlioz will be a true disruptor in the market as it becomes a lifestyle drug that pushes sales for the company sharply higher.

However, it's the insider activity taking place that really convinced me the stock is going to skyrocket soon. As of June 2017, insiders had issued themselves another 643,000 options since the start of the year. I can tell you from my years of working on Wall Street that it's important to pay attention to what the management team of a company is doing. If insiders are buying shares of a company's stock, it's a good indicator of strength and large gains ahead.

Between this recent insider buying and Vanda’s sales projections, I believe it won’t take long before Wall Street wakes up to this stock. That’s why now is the time to buy in, right before the institutions bid it up for us.

**Action to take:** Buy the shares of Vanda Pharmaceuticals Inc. (Nasdaq: VNDA).
A Great Start for *Extreme Fortunes*

These are just five of the 43 stocks that have the potential to rally 1,000% or higher each year. These companies meet my system of identifying companies that have the three key signs that point to a price explosion:

- Phase 1: Focus on companies that will disrupt the industry.
- Phase 2: Focus on the numbers – specifically sales growth.
- Phase 3: Focus on insider activity.

And with my *Extreme Fortunes* service, I will continue to uncover great opportunities for my subscribers. To make sure that you can take advantage of all the massive gains that are still coming your way with this system, be sure to read the *Extreme Fortunes* trading manual.

Regards,

Paul Mampilly
